(click on the picture to view it in full size or download the PDF below)

Notes: The key combinations generally have to be pressed simultaneously, but a `-` between one or more keys means that it is a sequence (press them one after another). The `Accelerator` key is usually mapped to `Ctrl`.

It is generated directly from the config file, so all combinations are included. Since JupyterLab is still under development some could not yet work. I only changed the order a bit, put related groups close to each other and to make it fit better on the page. You can also download it as [PDF here](#).

The generator is implemented in Node.js, it is also on my Github as [jupyter-shortcuts](#). You can simply clone it, run `yarn install` and then start it with `yarn start-default` to use the supplied default config file or `yarn start your/changed/config.json` to generate it from custom shortcuts. It provides a small http server with the generated page.

The json data can be obtained/edited in JupyterLab through: Settings > Advanced Settings Editor > Keyboard Shortcuts. There is currently (version 0.35.4 as time of writing) no builtin visual settings editor, this will change in the next versions with the [shortcutui extension](#).

---
